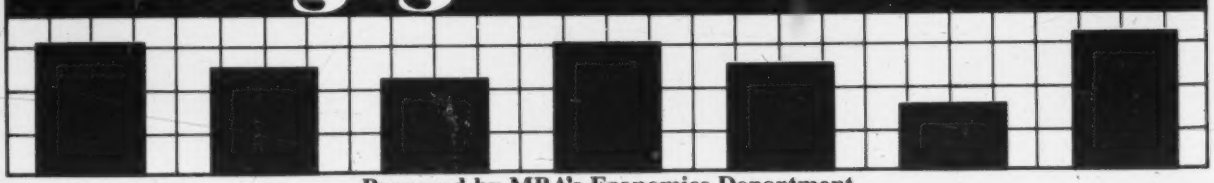
Mortgage Market Trends



Prepared by MBA's Economics Department

This year appears to be headed downward in terms of the real level of activity for mortgage bankers, as well as for other lenders. Inflationary pressures, however, should keep the dollar volume of activity relatively strong.

Origination volume in one- to four-unit residential mortgages should be in the area of $44 billion to $46 billion, while income property originations range between $8 billion and $10 billion. Thus, 1980 long-term mortgage originations are not likely to be significantly different than those achieved in 1979. However, the expectation is that 1980's origination volume will approximate that of 1979. This will be totally based on inflation, as real levels of activity decline.

Loan servicing portfolios will also grow during 1980 as larger loans continue to be added to existing portfolios. The total servicing portfolio of mortgage bankers is expected to exceed $210 billion by the end of 1980.

Mortgage bankers' profitability suffers in the same manner as that of other mortgage lenders during periods of inverted yield curves. Short-term interest rates are expected to equal or exceed the mortgage rate through the first half of 1980 before reversing. Therefore, the negative spread on carrying loan inventories during the first half of the year will cause serious deterioration in the profit margin for most firms, particularly those heavily engaged in residential lending. It is, however, likely that inventory levels will be lowest during that part of the year when the interest rate spread is most unfavorable.

As the level of general economic activity declines during the first quarter of 1980, consumers will reduce consumption and borrowing and credit demands will subside. Likewise, business demand for short-term credit is not only likely to decrease but could shift to the long-term debt market. As businesses that have recently been financing operations with short-term funds begin to see some softening in long-term interest rates, they are likely to refinance much of their short-term debt in longer maturities.

The increased demand for long-term credit on the part of the business sector will be accommodated by investors who have acquired short-term investment portfolios in recent months. As the rates begin to soften, investors will attempt to switch their portfolio from short- to long-term. This switching of maturities on the part of investors and borrowers alike will lead to a downward trend in interest rates that is marked by temporary disruptions, with short-term rates falling more rapidly than long rates. The yield curve should thus approach a flat shape during the second quarter and a "normal" pattern by the second half of the year.

Dr. Thomas R. Harter, Chief Economist
